BEHAVIOUR & BIOLOGY

DDA A pangolin is a rare and unique scaly mammal, a specialised ant-eater designed especially for the task.

DDA

It feeds only on termites and ants, and eats at least 2,00,000 a day! It has strong claws to dig up termite mounds, and even climbs up trees to get to ant nests.

DDA

When threatened, it rolls itself into a tight ball creating an armour with its tough scales - a primary defence mechanism.

DDA

Pangolin is a solitary species.

DDA

Pangolins are active at night, spending their days hidden in dark burrows often in rock caves.

Schedule I of the Indian Wildlife Protection Act

ILLEGAL WILDLIFE TRADE CATEGORY

TROPHY (scales used to make fashion accessories)

MYTH AND TRADITIONAL MEDICINE

(scales used in traditional Chinese medicine)

MEAT (eaten by hunters or for local demand)

SOURCE TRANSIT CONSUMER

A local hunter sets up a trap for a pangolin

Once caught, they kill the animal and rip out its scales

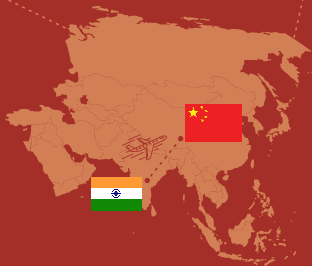

THIS IS A BRUTAL & BLOODY PROCESS

The scales are bought by the local dealer

The scales are then sold at a high price to the main dealer in the city

The scales are then transported over a flight, going to China

The scales are sold to the main dealer in China

The scales are bought by a distributor

The scales are sold to a traditional medicine healer

The scales are used to make a medicine that has absolutely no scientific basis

The consumer buys the medicine

The consumer takes the medicine in his/her home
